Multi-Label Classification

- is the supervised learning problem where an instance may be associated with multiple labels

Binary Relevance

- ❑ Decomposes learning tasks into independent binary problems.
- ❑ Returns a propensity/prediction vector for each response
- ❑ We fit each response independently

Metrics: Exact Match Ratio

- ❑ Predictions that are exact matches to the response vectors are considered accurate
- ❑ Partial matches are considered errors

Common Cost Functions Neural Nets

- Binary Cross-Entropy
- Loss Function

$$J(w) = -\frac{1}{n} \sum (y \log \hat{p} + (1 - y) \log(1 - \hat{p}))$$

- Gradient

$$\nabla J(w) = \hat{p} - y$$
